

# Protection for Lithium-Ion Batteries (3-/4-serial cells) Monolithic IC MM1414

April 14, 1999

## Outline

This IC protects lithium-ion batteries in the event of overcharge, overdischarge and overcurrent. It has the following two functions: an overcharge detection function that turns the external FET-SW off when a problem occurs during charging, etc. and excess voltage is impressed on each battery for longer than a certain time, and an overdischarge detection function that turns the external FET-SW off when battery voltage drops below a certain voltage during discharge, in order to prevent battery overdischarge. When these functions operate, the IC enters low current consumption mode. It also has an overcurrent detection function that turns the FET-SW off when excess current flows due to a short or the like. Since the functions above are provided, the protection circuitry for lithium-ion batteries can be comprised with fewer external components.

## Series Table

Temperature conditions A:  $T_a = -25 \sim 75^\circ\text{C}$ , B:  $T_a = -20 \sim 70^\circ\text{C}$ , C:  $T_a = 0 \sim 50^\circ\text{C}$ ,  
D:  $T_a = 0 \sim 40^\circ\text{C}$ , E:  $T_a = -20 \sim 25^\circ\text{C}$

**Pin Description**

Pin No.	Pin name	I/O	Functions
1	OV	Output	Overcharge detection output pin NPNT <sub>r</sub> open collector output Normal: high impedance Overcharge: Low
2	N.C		
3	CS	Input	Overcurrent detection pin Monitors load current equivalently by the voltage drop between discharge control FET source and drain, and makes DCHG pin high when the voltage goes below overcurrent detection voltage, turning off discharge control FET. After overcurrent detection, current flows from this pin and when there is a light load, overcurrent mode is released. This function does not operate in overdischarge mode.
