

# IC for Regulator+Reset Monolithic IC MM1688 Series

## Outline

This IC is a regulator (2 circuits) + reset IC developed for optical disc drives such as DVD-ROM drives. Regulator output voltage and reset detection voltage are fixed, while regulator output voltage and reset detection voltage are programmable ranging from 1.5V to 5.0V, and 2.7V to 5.0V respectively upon request.

## Features

1. Output voltage accuracy                     $\pm 2\%$
2. Dropout voltage                            0.06V typ. ( $I_o=70\text{mA}$ , regulator 1, 2)
3. Large output current                      300mA max.
4. High ripple rejection                      80dB typ. (regulator 1, 2)
5. Incorporates thermal shutdown circuit
6. Incorporates current limit circuit
7. Reset detection voltage                    1.5 to 5.0V
8. Delay time from voltage detection to reset release can be easily programmed.

## Packages

1. SOP-8D
2. HSOP-8A

## Applications

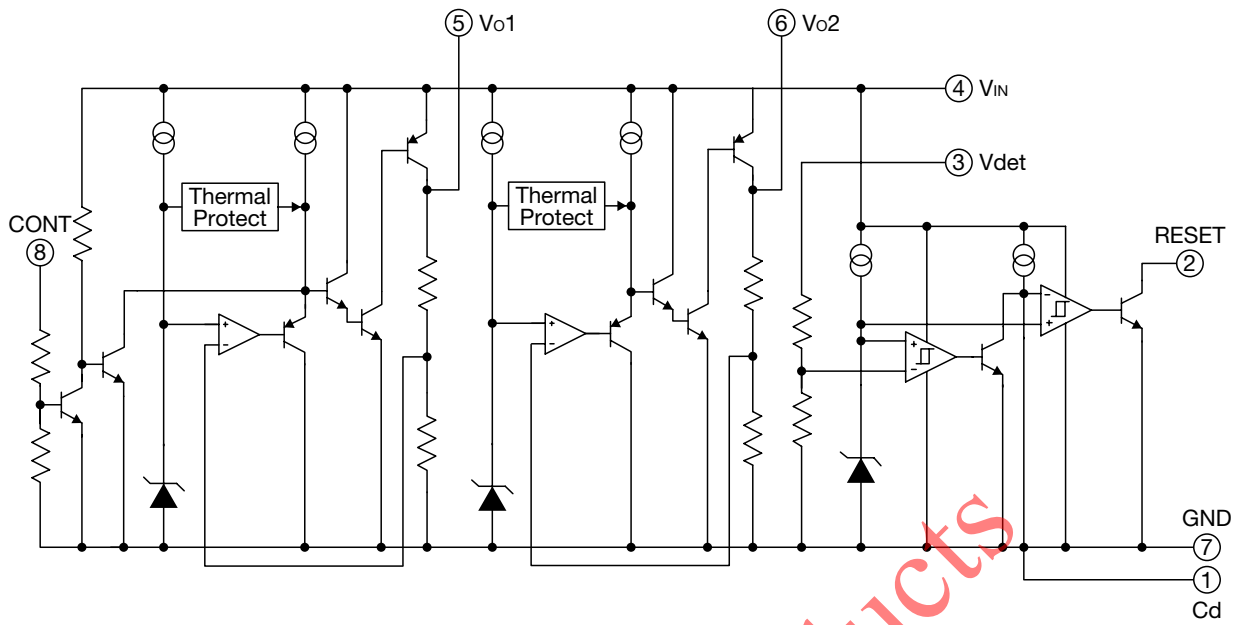

1. CD-ROM drive
2. Optical disc drivers

Measuring Circuit

Application Circuit

\*Temperature Characteristics: B Type

Note

1. The output capacitor is required between output and GND to prevent oscillation.
2. The output capacitor must be used in ESR stable area.  
It is possible to use a ceramic capacitor without ESR resistance for output.  
The ceramic capacitor must be used more than 1µF and B type temperature characteristics.
3. The wire of V<sub>CC</sub> and GND is required to print full ground plane for noise and stability.
4. The input capacitor must be connected in 1cm from the input pin.
5. In case the output voltage is above the input voltage, the overcurrent flows by internal parasitic diode from output to input. In such application, the external bypass diode must be connected between output and input pin.
