

3ch HD-capable Video Amplifier IC Monolithic IC MM1794

April 28, 2009

Outline

This IC is a wide bandwidth 75Ω driver IC compatible with D3(1080i) that was developed for small mobile devices.

Since it is compatible with dual power supplies, an output coupling capacitor is not required, which contributes to minimizing the space for the set.

Furthermore, ultra low current consumption is achieved in consideration to the battery driving time of mobile devices.

Features

1. Ultra low current consumption : 30mA
2. Ultra-small package : SQFN-16
Body size : 3.0×3.0mm, non-lead type
3. Dual power supply specifications($V_{CC}=+3.0V$, $V_{EE}=-6.0V$) make output coupling capacitor unnecessary

Package

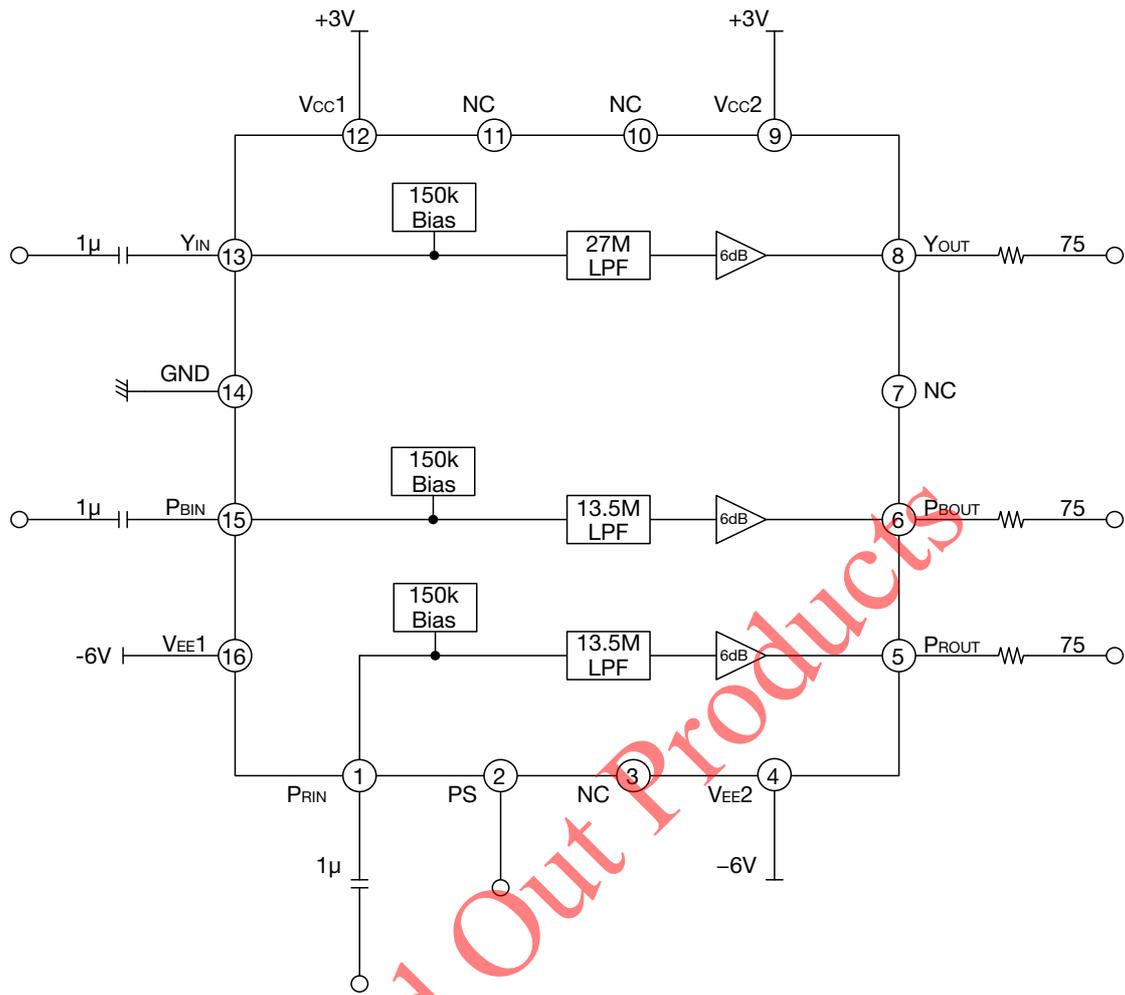

SQFN-16

Applications

1. Digital still cameras
2. DVD/Blu-ray disk drives
3. Set top boxes

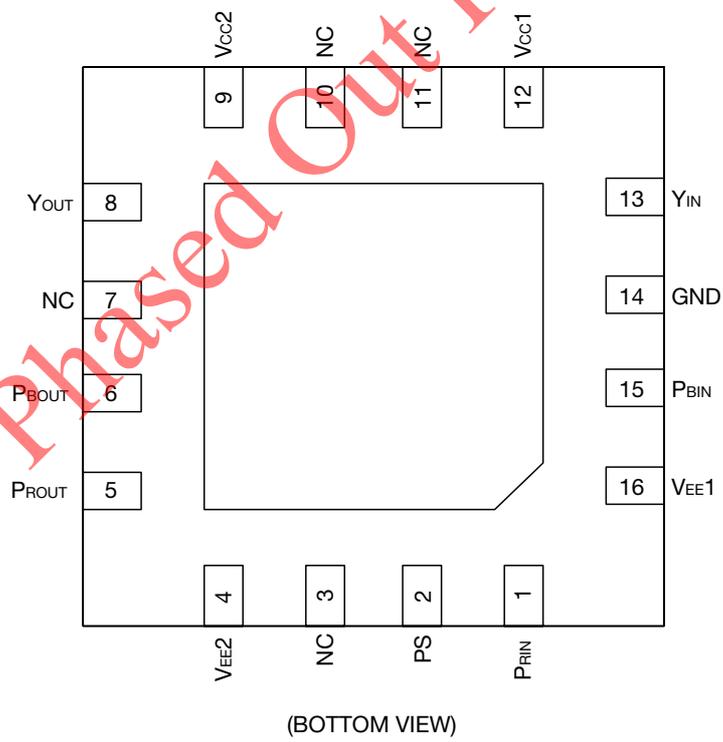

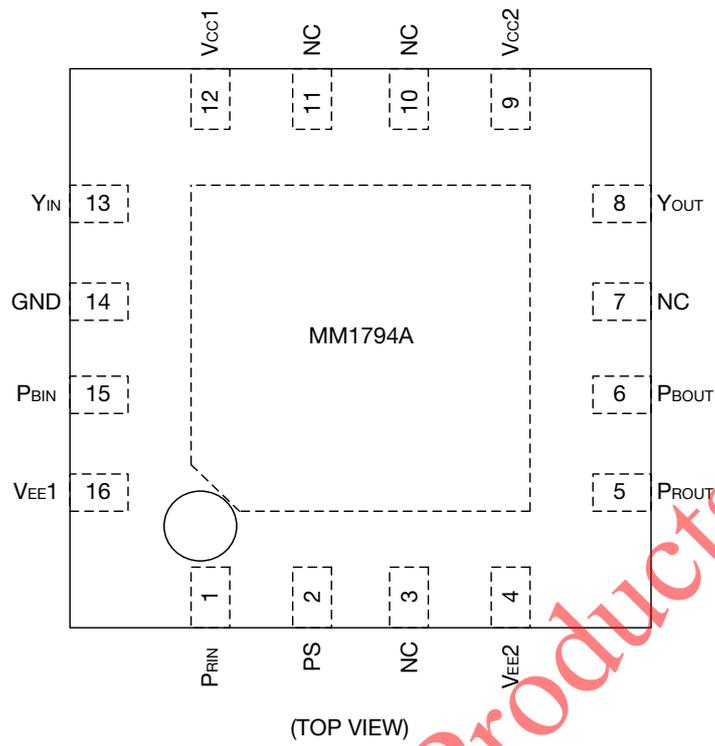

Phased Out Products

Block Diagram

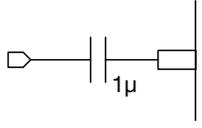

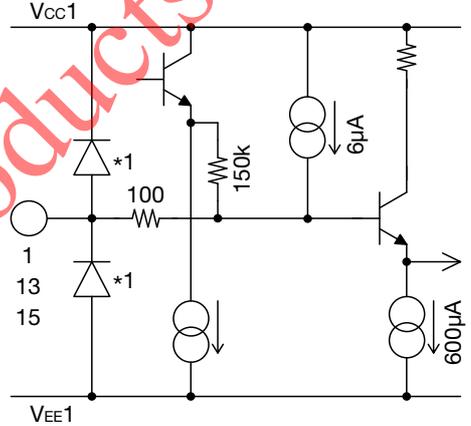

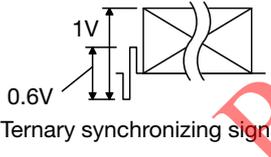

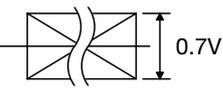

- Note : V_{CC2} (9pin) and V_{EE2} (4pin) are the power supplies for the output circuits inside IC.
- V_{CC1} (12pin) and V_{EE1} (16pin) are the power supplies for the other circuits inside IC.
- Note : V_{CC1} and V_{CC2} are open inside IC. Be sure to use it, connecting by external wiring.
- Note : V_{EE1} and V_{EE2} short-circuit by the substrate inside IC. The resistance of a substrate is not low. Be sure to use it, connecting by external wiring.

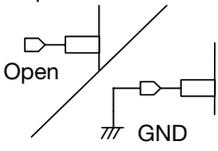

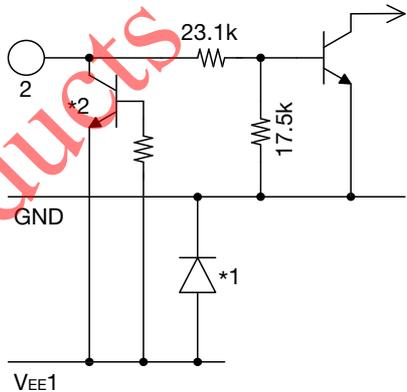

Pin Assignment

1	PRIN	6	PBOUT	11	NC	16	VEE1
2	PS	7	NC	12	VCC1		
3	NC	8	YOUT	13	YIN		
4	VEE2	9	VCC2	14	GND		
5	PROUT	10	NC	15	PBIN		

Pin Description

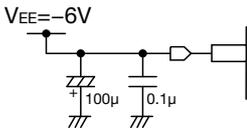

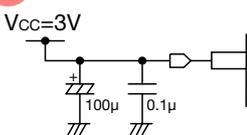

Pin No.	Pin name	Pin description	
		Function	
		Component Y, Color difference P _B , P _R Signal Input or RGB Signal Input Pin to input component Y, Color difference P _B , P _R signals or RGB signals. Pin Voltage : 0V typ. Input Impedance : 150kΩ

Phased Out Products

Absolute Maximum Ratings (Except where noted otherwise, Ta=25°C)

Item	Symbol	Ratings	Units
Storage temperature	T _{STG}	-55~+150	°C
Operating temperature	T _{OPR}	-40~+85	°C
Positive supply voltage	V _{CC} max.	+5.5	V
Negative supply voltage	V _{EE} max.	-7.5	V
Power dissipation	P _{D1} (Note1)	1.0	W
	P _{D2} (Note2)	1.1	W

Note1 : Board mounting power dissipation. Board size 110×41×0.8mm
 Layer : 4 Layers Material : Glass epoxy Wire rate : 65% TAB solder : nothing(0%)
 Note2 : Board mounting power dissipation. Board size 110×41×0.8mm
 Layer : 4 Layers Material : Glass epoxy Wire rate : 65% TAB solder : 100%

Recommended Operating Conditions

Item	Symbol	Ratings	Units
Operating temperature	T _{OPR}	-40~+85	°C
Positive operating voltage	V _{CCOP}	2.7~5.3	V
Negative operating voltage	V _{EEOP}	-7.5~-5.5	V

Phased Out Products

Electrical Characteristics (DC Character) (Except where noted otherwise, Ta=25°C, VCC=3V, VEE=-6V)

Item	Symbol	Measurement conditions	Min.	Typ.	Max.	Units	
Positive Supply current	ICC	No signal VPS=3V	21	30	39	mA	
Negative Supply current	IEE	No signal VPS=3V	21	30	39	mA	
Positive Supply current on Power Save	ICC_PS	No signal PS open or VPS=0V		0.1	1	μA	
Negative Supply current on Power Save	IEE_PS	No signal PS open or VPS=0V		0.1	1	μA	
Terminal voltage	Input	VIN	13, 15, 1pin		0.0	V	
	Output	VOUT	8, 6, 5pin	-0.18	0.0	0.18	V
	Output 75Ω termination	VOUT75	75Ω termination point	-0.09	0.0	0.09	V
PS Control terminal input voltage	High	VPSH	2 pin	2.0		VCC	V
	Low	VPSL	2 pin	GND		1.0	V
PS terminal input current	IPSH	2 pin VPS=3V	50	85	120	μA	
PS terminal leak current	IPSL	2 pin VPS=0 V		30	100	nA	
Negative Power Supply permission reverse voltage (Note4)	VEEreverse1	No signal at Power Save			0.36	V	
	VEEreverse2	Ta=85°C No signal at Power Save			(0.16) (Note3)	V	

Note3 : The inside of a parenthesis is a design guarantee value.

Note4 : About Negative Power Supply permission reverse voltage.

It is the specification applied at the time of the power save ON (PS terminal 0 - 1V or Open).

If the potential between GND-VEE is reversed (VEE>GND) and permission voltage is exceeded when VEE is OFF and VCC is ON, parasitism diode will turn on and current will flow between VCC-GND.

When VEE is OFF and VCC is ON, please hold down the voltage between VEE-GND to below "Negative Power Supply permission reverse voltage".

Power Save ON (PS<1V or Open)		Positive Power Supply VCC	
		ON (Example : +3V)	OFF (Open)
Negative Power Supply VEE	ON (Example : -6V)	don't care	don't care
	OFF (Open)	VEE-GND<Negative Power Supply permission reverse voltage	don't care

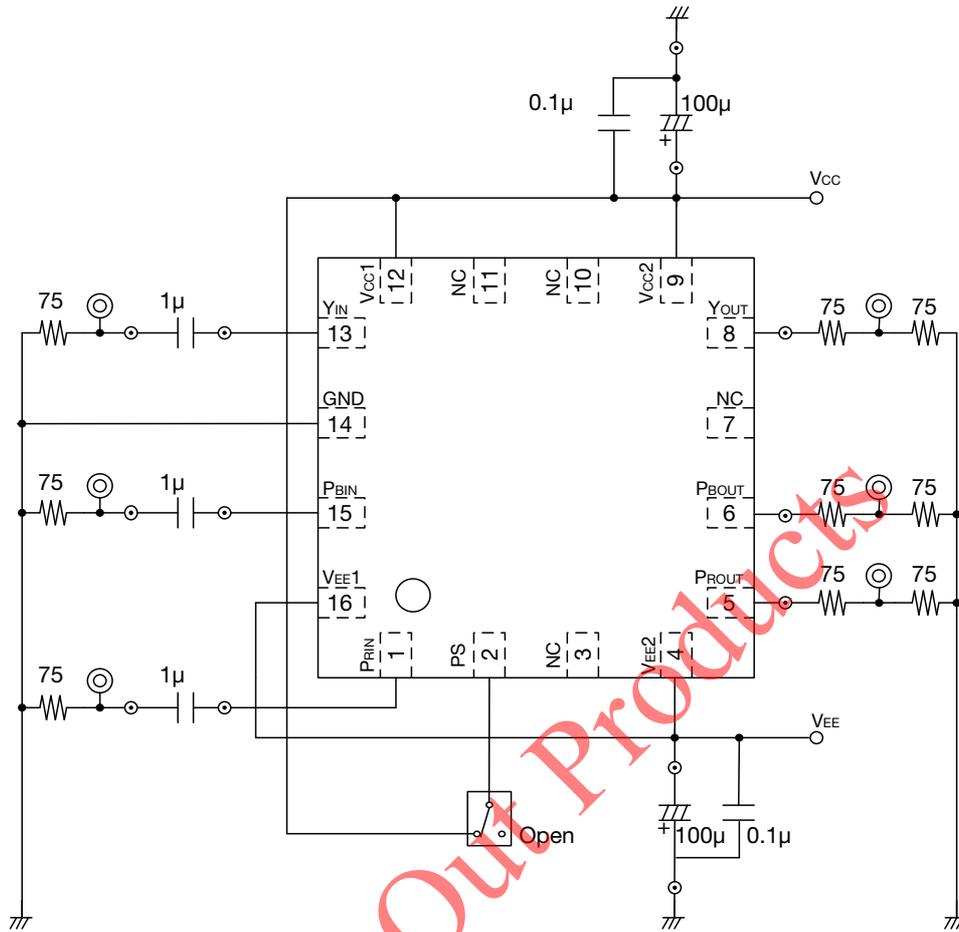

Note : When a device is the power save OFF(active), VEE=OFF and VCC=ON are prohibition conditions.

Power Save ON =Device Active (PS>2V)		Positive Power Supply VCC	
		ON (Example : +3V)	OFF (Open)
Negative Power Supply VEE	ON (Example : -6V)	don't care	don't care
	OFF (Open)	Prohibition	don't care

Electrical Characteristics (AC Character) (Except where noted otherwise, $T_a=25^{\circ}\text{C}$, $V_{CC}=3\text{V}$, $V_{EE}=-6\text{V}$)

Item	Symbol	Measurement conditions	Min.	Typ.	Max.	Units
Input impedance	Y_{IN} , P_{BIN} , P_{RIN}	13, 15, 1pin	100	150	200	$k\Omega$
Voltage gain	G_Y, P_B, P_R	SIN wave : 1V $f=100\text{kHz}$	5.7	6.0	6.3	dB
Frequency characteristic 1 (Y)	f_{1Y}	SIN wave : 1V 27MHz/100kHz	-3.0	-1.0		dB
	f_{2Y}	SIN wave : 1V 54MHz/100kHz		-26	-20	dB
Frequency characteristic 2 (P_B, P_R)	f_{3P_B, P_R}	SIN wave : 1V 13.5MHz/100kHz	-3.0	-1.0		dB
	f_{4P_B, P_R}	SIN wave : 1V 54MHz/100kHz		-30	-20	dB
Output dynamic range	DR_{YOUT} , P_{BOUT}, P_{ROUT}	SIN wave : 100kHz THD=1.0%	2.6	3.0		V
Group delay 1 (Y)	t_{1GDY}	at 100kHz		20	40	ns
Group delay 2 (P_B, P_R)	t_{2GDP_B, P_R}	at 100kHz		20	40	ns
Group delay deviation 3 (Y)	Δt_{3GDY}	to 4MHz		1	10	ns
		to 12MHz		1	10	ns
Group delay deviation 4 (P_B, P_R)	$\Delta t_{4GDP_B, P_R}$	to 4MHz		1	10	ns
		to 6MHz		1	10	ns
		to 12MHz		6	15	ns
Between channel Group delay deviation 5	Δt_{5chGD}	Between Y and P_B (P_R) at 4MHz		2	10	ns
Between channel Group delay deviation 6	Δt_{6chGD}	Between Y and P_B (P_R) at 12MHz		5	10	ns
Differential gain	DG (Y_{OUT})	Staircase signal 1V		1	2	%
Differential phase	DP (Y_{OUT})	Staircase signal 1V		1	2	deg
Crosstalk 1	CT1	$f=4.43\text{MHz}$, 1V		-60	-55	dB
Crosstalk 2	CT2	$f=20\text{MHz}$, 1V		-45	-40	dB
S/N	SN_Y , P_B, P_R	BW : 100k~12MHz		65		dB

Measuring Circuit

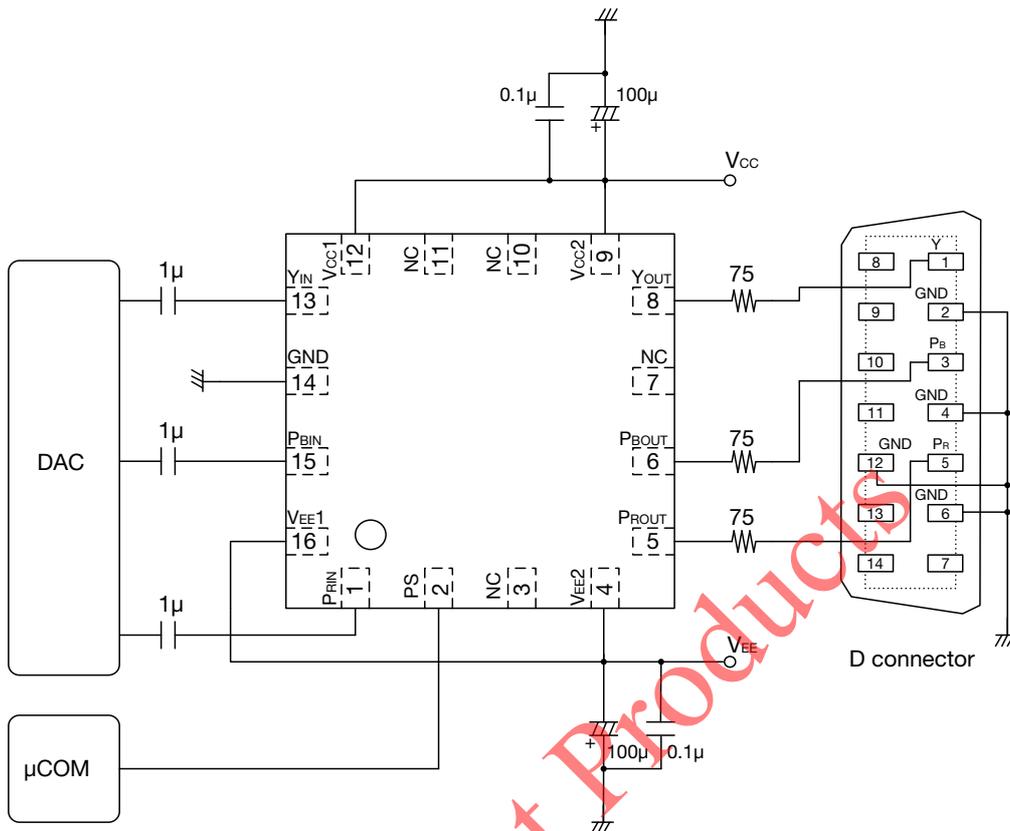

Switch Control Table

■ Power save select

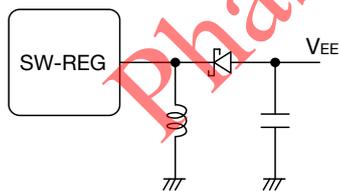

Control terminal	Power save
PS	
Low (Open)	ON
High	OFF

Application Circuit

Note : Please arrange power supply bypass capacitor near the V_{CC} (V_{EE}) terminal (pin).
 Note : Please arrange the stray capacity component added to a signal output terminal to 20pF or less.

Typical Negative Power Supply Circuit

Note : In modes of operation, such as standby of the set to be used, When V_{CC} is turned on in the state of V_{EE}OFF for a long time, Please clamp a V_{EE} terminal with schottky barrier diode etc. and be not lifted 0.36V(T_a=25°C) or more from GND potential.
 For example, it is satisfactory also as negative power circuit composition which used switching regulator as shown in the above figure.

■ Power supply starting (bringing down) sequence recommendation

	Starting	It brings down
Recommendation	<p>The diagram shows three signals: PS, VCC, and VEE. PS starts at +3V and goes OFF. VCC starts at +3V and goes OFF. VEE starts at OFF and goes to -6V. Vertical dashed lines indicate the timing of these transitions.</p>	<p>The diagram shows three signals: PS, VCC, and VEE. PS starts at +3V and goes OFF. VCC starts at +3V and goes OFF. VEE starts at OFF and goes to -6V. Vertical dashed lines indicate the timing of these transitions.</p>
Conditional permission	<p>The diagram is similar to the 'Starting' sequence, but a shaded area between the VEE transition and the VCC transition indicates a period of conditional permission where VEE is clamped to -6V while VCC is OFF.</p>	<p>The diagram is similar to the 'It brings down' sequence, but a shaded area between the VEE transition and the VCC transition indicates a period of conditional permission where VEE is clamped to -6V while VCC is OFF.</p>

Conditional permission
 (A permission is granted only when V_{EE} potential is clamped to 0.36V(T_a=25°C) or less for external diode.)

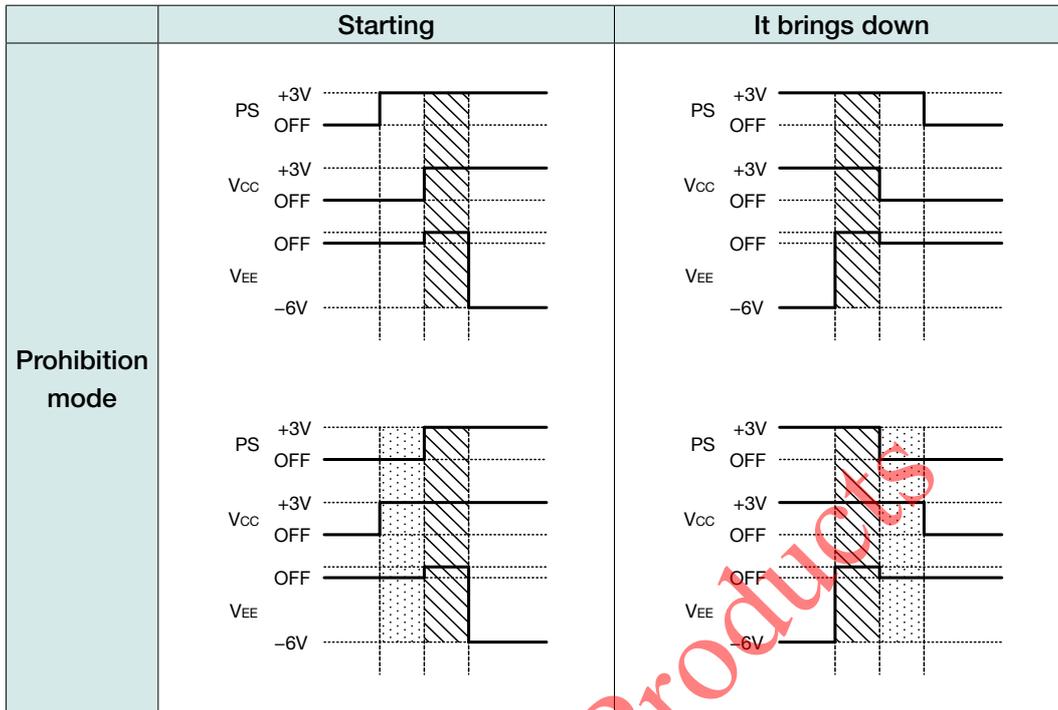

Note : If V_{CC} turns on in the state where substrate potential is unfixed, parasitic diode will turn on and an overcurrent (about 70mA) will flow between V_{CC}-GND.

Note : When you use the sequence which turns on V_{CC} at the time of V_{EE} OFF, Please insert the sufficiently low element of V_f like schottky barrier diode between V_{EE}-GND, and press down V_{EE} potential to 0.36V(T_a=25°C) or less.

Phased Out Products

■ Power supply starting (bringing down) sequence prohibition mode

Let power supply operation in case PS terminal is High be prohibition mode.

/// Prohibition mode

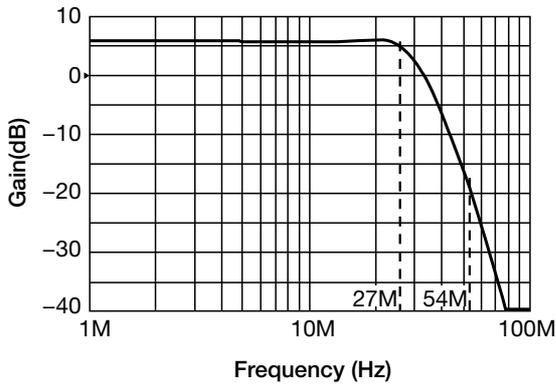

Note : Since the current between V_{CC} - V_{EE} increases when PS terminal is High (Active), it becomes impossible for a diode clamping circuit to be unable to prevent an overcurrent, either.

Please be sure to set PS terminal to Low (Open) in the case of power supply operation in which the potential of V_{EE} becomes unfixed.
