*1 Voltage gain G_v, frequency response F_c

If input at TP1 for 0.1MHz sine wave input is V₁, and output at TP3 is V₂, and output for 10MHz input is V₃, then :

$$G_v = 20 \text{LOG} \frac{V_2}{V_1}$$

$$F_c = 20 \text{LOG} \frac{V_3}{V_2}$$

*2 Crosstalk C_T

If input at TP1 for 4.43MHz sine wave input is V₄, and output at TP3 is V₅, then :

$$C_T = 20 \text{LOG} \frac{V_5}{V_4}$$

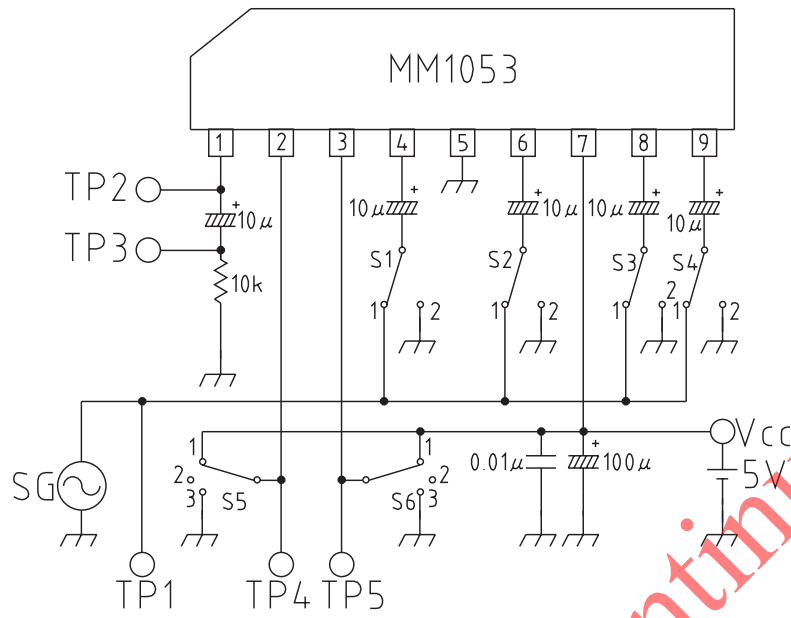

*3 Switching voltage V_{TH1}, V_{TH2}

TP4 level is V_{TH1} when TP4 DC level is changed by the external power supply and the output signal switches. TP5 level is V_{TH2} when TP5 DC level is changed by the external power supply and the output signal switches.
